702. Search in a Sorted Array of Unknown Size

Medium

Add to List

Share

This is an *interactive problem*.

You have a sorted array of **unique** elements and an **unknown size**. You do not have an access to the array but you can use the `ArrayReader` interface to access it. You can call `ArrayReader.get(i)` that:

- returns the value at the  $i^{\text{th}}$  index (**0-indexed**) of the secret array (i.e., `secret[i]`), or
- returns  $2^{31} - 1$  if the `i` is out of the boundary of the array.

You are also given an integer `target`.

Return the index `k` of the hidden array where `secret[k] == target` or return `-1` otherwise.

You must write an algorithm with  $O(\log n)$  runtime complexity.

Example 1:

Input: `secret = [-1,0,3,5,9,12]`, `target = 9`

Output: `4`

Explanation: 9 exists in secret and its index is 4.

Example 2:

Input: `secret = [-1,0,3,5,9,12]`, `target = 2`

Output: `-1`

Explanation: 2 does not exist in secret so return `-1`.

Constraints:

- $1 \leq \text{secret.length} \leq 10^4$
- $-10^4 \leq \text{secret}[i]$ ,  $\text{target} \leq 10^4$
- `secret` is sorted in a strictly increasing order.

```
/**
 * // This is ArrayReader's API interface.
 * // You should not implement it, or speculate about its implementation
 * interface ArrayReader {
 *     public int get(int index) {}
 * }
 */

class Solution {
    public int search(ArrayReader reader, int target) {

    }
}
```
